For pre-1999 C, the only real solution is to assign to each member; for C99 and later, a compound literal, as in CesarB's answer, is the solution. (Of course an actual initializer, with or without designators, would be even better, but apparently the OP was saddled with a really bad coding standard.)

Enumeration (or enum) is a user-defined data type in C. It is mainly used to assign names to integral constants, the names make a program easy to read and maintain. enum State {Working = 1, Failed = 0}; The keyword 'enum' is used to declare new enumeration types in C and C++. Following is an example of enum declaration.

The ANSI C library follows this practice. If a pointer is used only to give a function access to values, the pointer is declared as a pointer to a const-qualified type. If the pointer is used to alter data in the calling function, the const keyword isn't used. For example, the ANSI C declaration for strcat() is this:
