Hi guys, I'm just curious about how does Classical Electrodynamics by Hans Ohanian and Electromagnetic Fields by Ronald Wangsness compare? I know Griffiths is like the way to go when it comes to EM, but personally, I find his book too hand wavy and the explanations are sometimes lacking, so I decided if ever I'm going to review or choose a reference in EM what would it be aside from Griffiths?

Bremsstrahlung / ˈbrɛmʃtʁaːlʊŋ / (German pronunciation: [ˈbrɛms.ʃtʁaːlʊŋ] ()), from bremsen "to brake" and Strahlung "radiation"; i.e., "braking radiation" or "deceleration radiation", is electromagnetic radiation produced by the deceleration of a charged particle when deflected by another charged particle, typically an electron by an atomic nucleus.

Descrizione. In particolare il paramagnetismo si osserva in quei materiali le cui molecole posseggono un momento di dipolo magnetico proprio, quindi si ha un effetto prevalentemente dovuto a polarizzazione magnetica per orientamento e trascurabile precessione di Larmor, come l'aria e l'alluminio. Nel caso dell'aria, l'effetto paramagnetico è a carico della molecola di ossigeno che possiede ...

In Newtonian mechanics, linear momentum, translational momentum, or simply momentum is the product of the mass and velocity of an object. It is a vector quantity, possessing a magnitude and a direction. If m is an object's mass and v is its velocity (also a vector quantity), then the object's momentum p is $=$. In the International System of Units (SI), the unit of measurement of momentum is the ...

In fisica, l'induzione elettrica, anche detta spostamento elettrico, è un campo vettoriale utilizzato in elettromagnetismo per descrivere la polarizzazione elettrica di un materiale dielettrico in seguito all'applicazione di un campo elettrico. Si tratta di una generalizzazione del campo elettrico utilizzata nelle equazioni di Maxwell per descrivere l'effetto delle cariche di polarizzazione ...
