1. Introduction. Ever since the field of science has originated, researchers and technologists have been busy in solving the complexity of the human brain that is a maze of neurons interconnected with each other and transmitting signals to the whole body. 1 To design a model that will mimic just like the human brain has remained a big puzzle to solve for the scientific community.

Bone Regeneration. Bone regeneration in clinical contexts requires three key components: an osteoinductive signal, an insoluble substratum that delivers the signal and acts as a scaffold for the induction of new bone formation, and host recipient cells that are capable of differentiation into bone cells in response to the osteoinductive signals.
