Heavy And Extra Heavy Oil

Heavy crude oil (or extra heavy crude oil) is highly-viscous oil that cannot easily flow to production wells under normal reservoir conditions. It is referred to as "heavy" because its density or specific gravity is higher than that of light crude oil. Heavy crude oil has been defined as any liquid petroleum with an API gravity less than 20°.

Heavy and Extra-heavy Oil Upgrading Technologies - 1st Edition

Heavy oil is defined as petroleum which has a density equal or lower than 20 API, but if petroleum has 10 API or less it is considered as extra heavy oil or bitumen, which is denser than water. The difference between bitumen and extra heavy oil is ambiguous and usually refers to the production technology, so we will include both under the term extra-heavy oil.

• Extra-heavy oil and oil sands contributing to 7% of liquid hydrocarbon supply in 2030: key contributors to world energy supply • Extra-heavy oil: a major segment of Total's growth strategy • Strong R&D commitment to increase recovery, to mitigate costs, to improve energy efficiency, to reduce GHG emissions,

EXTRA HEAVY OILS IN THE WORLD ENERGY SUPPLY

Natural bitumen and extra-heavy oil are the remnants of very large volumes of conventional oils that have been generated and degraded, principally by bacterial action. Chemically and texturally, bitumen and extra-heavy oil resemble the residuum generated by refinery distillation of light oil.

Natural bitumen and extra-heavy oil - USGS

Recent studies estimate that unconventional oil reserves, including heavy oils, extra-heavy oils and bitumen exceed 6 trillion barrels. This amount is equivalent to about 70% of all energy resources derived from fossil fuels in the world (Oilfield Review Summer, 2006).

The properties of heavy and extra-heavy petroleum are comparable to those of the vacuum (565°C+ VR) and atmospheric (345°C+ AR) residua. Heavy petroleum is constituted by heavy hydrocarbons, and several metals (Riazi, 2005). Typical amounts of impurities of different petroleum are shown in Table 3.

Compared with light oil, heavy oil is more costly to produce, process, and transport. In many cases, extra heavy oil must be chemically upgraded to lower density. In the Venezuelan Orinoco heavy oil belt, for example, about 1 bbl of diluent is required for every 3 or 4 bbl of extra-heavy oil.

The Challenges of Processing and Transporting Heavy Crude

Márquez and Brito present three variables to guide the selection of a suitable desander for heavy and extra heavy oil: particle size, sand concentration, and liquid properties (viscosity and density). To facilitate the transportation of the Orinoco Belt extra heavy oil, it is diluted to reduce the viscosity and increase the density.

Abstract: The transportation of heavy and extra-heavy crude oils from the head-well to the refinery is of significant economical, technical and scientific concern since the production of such crude oils is rising over the world in the last years. In this paper, the current technological solutions to move the crude oils from the production site to the processing facilities are discussed through the analysis of recent and first innovative patents on the field.
