Our main transformer type, Class 2 Transformer offers an output voltage not greater than 30V. TE's step down transformers are used to reduce electrical shock by supplying low secondary voltage. A step down transformer is a transformer whose output (secondary) voltage is less than its input (primary) voltage.

### Step Down Transformers | TE Connectivity

A current transformer or voltage transformer provides secondary current for alternating current (AC), while a DC shunt provides a low-resistance path resistance for direct current (DC). Current transformers are used for alternating current (AC), while a DC shunt device provides low-resistance path for direct current (DC).

A Transformer can have multiple types of construction. Transformer does not have any electrical connection from one side to another; still, the two electrically independent coils can conduct the electricity by electromagnetic flux. A transformer can have multiple coils or windings on the primary side as well as on the secondary side.
