Using high spatial and time resolution of moored temperature sensors, the transition toward the upslope flow (cooling phase) is described as a rapid upslope-propagating bore, likely generated by breaking trapped internal waves. Buoyant anomalies are found during the bore propagation, likely resulting from small-scale instabilities.

The high-resolution bio-optical observations reveal more details of small-scale phytoplankton structures. By tracking these small-scale biological features, one can determine the circulation pattern if the motion speed is large with respect of the growth and grazing of the phytoplankton (Pegau et al., 2002).
